

LocalMaps 3.2.2 Release notes

Administration:

- Query parameters can now be created.
- Administrators can set the order of Feature queries to appear in the Viewer pop-up.
- Administrators can add a publicly available ArcGIS Servers and services as data sources to LocalMaps.
- Secure data sources can be easily differentiated through the colours all through the application.
- Data source fields can now be whitelisted to allow limiting what is exposed to users.
- Create query using views and stored procedures.
- Data providers and sources list now includes an option to search and filter.
- Any configured data sources and providers can now be deleted. If it is in use, administrators are notified with a warning message and list of areas where it's been used before deletion.
- Connect to private data sources
- Search results will display only the fields that are part of the layer.
- Templates can be added to be used in the reports.
- Placeholders for dates, page numbers, and data from the layer can be included in the templates.
- Administrators can now configure conditional sections in a report, where the sections will appear in the report only when a spatial condition or conditional fields are met.
- Full page maps can now be added to the reports. Required layout available under a print service can be chosen
- Custom print templates from the print services can be chosen for the Print widget.
- Feature selection can be configured as needed. This includes allowing the administrator to change the outline colour and fill.
- Administrators can now enable/disable query parameters as needed.
- Administrators can now include secure data sources in reports which can only be generated when the end user is logged in.
